

QRX front with controls.

At last the controls of the QRX are fixed. I had 2 extended push buttons in stock as well as some cheap plastic potentiometers. The shafts were cut off and appeared to be hollow.

A 1/8 (3mm) drill was used to enlarge the shaft inside for aprx. 2mm.

Next the shaft was pushed over the button's shaft and fixed with superglue.

The original potentiometer was replaced by a longer one . A simple pice of modified shaft and a small pice of plastic tube were used to extend the encoder shaft.
